## CHIROPRACTIC AND NEUROLOGY

---

Since its beginnings, chiropractic has underscored the role of the nervous system as a key to our body's health. A healthy body generally possesses a well-performing nervous system and is able to manage physical, chemical or emotional stress in the best way possible.

Following this philosophy, over the last few decades, chiropractic is focusing much on Functional Neurology, a branch of chiropractic in which we try to help the nervous system not only through a standard clinical exam but through dynamic study of the patient.

This allows us to obtain much more significant answers and results because the chiropractor arrives at the root of the problem, and through movements or precise exercises, he can educate the body to recover lost or forgotten function.

The most prominent proponents of Functional Neurology are Dr Carrick and the researcher Heidi Haavik, who are working to highlight the key role of chiropractic for proper function of the nervous system.

Today our chiropractors can help you with different neurological conditions, and find relief or recovery in a large group of diseases. Dr Cnudde and Dr Braeckvelt specialise in functional neurology, have attended numerous seminars and can help you find the best balance.
